logical explanation of all architectural choices in the project.

I have used react js to develop the website and I have majorly used state management and hooks concept in this code.

I have used various features in the website and used and express libraries for the back end support.

I have used Getstream.io API to connect the server and frontend.

I have also considered various approaches for building the website but I have chosen this layout as it is user friendly and easy to use.

The architectural styles I have considered are figma templates and many other online templates and I later choosed a simple interface and proceded with my code building.
